PROFESSIONAL SUMMARY

Platform engineer with 9+ years of experience in freight and warehouse software at Tailspin Freight and Fabrikam Logistics. Enjoys turning slow, fragile batch jobs into observable streaming services, and writing the runbooks that let a small team sleep through the night.

CORE SKILLS

Languages: Go, Java, TypeScript, SQL
Infrastructure: Kubernetes, Terraform, Helm, Linux
Data: Postgres, ClickHouse, RabbitMQ
Practices: Incident Review • Contract Testing • Technical Writing

Fabrikam Logistics Platform

Staff Platform Engineer | March 2021 – August 2025

Warehouse Data Platform

- Rebuilt the nightly inventory reconciliation job as a streaming service in Go, so a pallet scanned on the dock showed up on store dashboards within seconds.
- Introduced a schema registry and contract tests for forty producer teams, so a breaking field change failed in code review instead of at three in the morning.

- Designed a sharded job scheduler with lease-based ownership that let route planning workers fail over between data centers without dropping queued work.
- Wrote the on-call handbook and a weekly failure review that halved repeat pages over two quarters.

Developer Tooling

- Built an internal command-line tool that creates a new service with logging, metrics and deployment manifests already wired in.
- Moved build caching to a shared remote store, bringing typical pull request checks from twenty minutes to under six.

LANTERNWORKS
Founding Engineer and Technical Advisor | May 2023 – Present

Product Engineering

- Started a volunteer scheduling app for community gardens with two friends.
- Wrote a TypeScript and Postgres backend that matches volunteers to garden shifts, sends reminders, and keeps a history of every plot

Operations

- Set up error tracking, nightly backups and a simple status page on a single low-cost virtual machine.
- Interviewed garden coordinators every month and turned their requests into a short public roadmap.

TAILSPIN
Backend Engineer II | September 2016 – February 2021

Freight Booking Services

- Maintained the Java booking service that priced and confirmed truckload orders for regional carriers.
- Wrote Kubernetes operators that restarted stuck pricing workers and posted each restart to the team channel.

Database Migration

- Moved the booking database from a single primary to a replicated cluster in stages, keeping carriers able to book throughout each cutover

Testing & Release

- Added contract tests and staged rollouts to the release process for the booking and invoicing services

EDUCATION

Bachelor of Science in Information Systems
Example State University

CERTIFICATIONS

HashiCorp Certified: Terraform Associate
Linux Foundation Certified System Administrator
